Screening of Access Management Options

Your input from the first public meeting, and input from the Corridor Preservation Committee, helped develop access management options as well as evaluation criteria to help assess the options. Access management options ranged from half-mile intersection spacing to a limited access roadway with interchanges and over-passes. The evaluation criteria included traffic impacts, cost and environmental impacts.

The evaluation criteria and feedback from the Corridor Preservation Committee were used to narrow the access management options to the proposed option for the corridor shown on the access management displays at this station.
