DEFINITIONS OF TERMS USED IN THE ANNUAL REPORT OF THE PAVEMENT MANAGEMENT SYSTEM

The following is a list of terms and appropriate definitions that appear in the annual Pavement Management reports -- SYSTDY and SUMMARY.

Route: The Route Number of the Highway (097 means State Highway 97, 084 means Interstate 84).

Material: The material out of which the surface pavement is composed. For SYSTDY, it is either flexible or rigid.

District: The Idaho State administrative district number. It can be 1 - 6.

Lanes Each Way: The number of lanes in each direction for the majority of the section. Special turn lanes or passing lanes that are relatively short are not included in this lane count.

BMP (Beginning Milepost): The milepost at the beginning of the testing section of highway.

EMP (Ending Milepost): The milepost at the ending of the test section of highway.

County: County location of the highway section.

City: highway section located in a city with a population of 1000 of greater.

TSI (Terminal Serviceability Index): The lowest acceptable cracking, roughness, or final index. Sections having a lower index than the TSI are considered to have a deficiency in that index rating.

Ascending/Descending: For a divided roadway, this shows the mileposting direction of the section of road being reported.

MACS (Segment Code): Six-digit number that identifies the section of highway according to the code in the Milepost and Coded Segment (MACS) System.

Functional Class: This displays the 2000 Functional Classification of the roadway. It can be Interstate, Principal Arterial, Minor Arterial, Major Collector, Collector, or Minor Collector.

RI (Roughness Index): The RI is a number from 0.0 to 5.0, 0.0 being extremely rough and 5.0 being perfectly smooth

Skid Index: A value (typically between 20 - 100) that represents the friction experienced by tires travelling on the pavement surface while wet. The lower the index, the less the friction between the pavement and the tire. This value is obtained using a locked wheel skid trailer.

Rutting: A measurement (in inches) of the rutting that occurs in the left and right wheel paths. This value is also averaged in a manner similar to the RI.

Crack Rating: This part of the report displays the Cracking Index (CI) for the section as rated annually by the Pavement Management Engineer. Cracking is described in terms of *extent* and *severity*. Extent is a measure of the total area exhibiting a particular type of cracking, and is characterized as low, medium, or high. Severity is a measure of a crack's width and is characterized as:

Slight - hairline to approx. 1/8 inch
Moderate - 1/8 inch to 1/2 inch
Heavy - 1/2 inch or more

The types of cracking recorded include:

Alligator - load related, primarily in wheel paths
Block - interconnected cracking due to thermal expansion and contraction and aging of the pavement
Edge - load related; is exhibited along the pavement's edge
Longitudinal - can be load (in wheel path) or construction cold joint related, parallel to the centerline of roadway
Transverse - thermal cracking, transverse to pavement centerline
